1 Function and Set

1.1 Function

$A \times B = \{(a, b) | a \in A, b \in B\}$.

Function is a rule σ that assigns an element B to *every* element of A .

$$\sigma : A \rightarrow B$$

$$\forall a \in A, \sigma(a) \in B.$$

$$\sigma(a) = \text{value of } \sigma \text{ at } a. \text{ (the image of } a \text{)}$$

A set $C \subset B$, we call $\sigma^{-1}(C) = \{a \in A | \sigma(a) \in C\}$ as the preimage of a .

An element $b \in B$, we call $\sigma^{-1}(b) = \{a \in A | \sigma(a) = b\}$ as the fiber of b .

A is the domain of σ , B is the range of σ .

1.1.1 Composition of functions

$\sigma : A \rightarrow B, \tau : B \rightarrow C$. The function $\tau \circ \sigma : A \rightarrow C$ is $\forall a \in A, (\tau \circ \sigma)(a) = \tau(\sigma(a))$

1.1.2 Proposition 1.1.3: Associativity of Functions

Proposition 1 (Proposition 1.1.3). $\sigma : A \rightarrow B, \tau : B \rightarrow C, \rho : C \rightarrow D$ functions then,

$$\rho \circ (\tau \circ \sigma) = (\rho \circ \tau) \circ \sigma$$

1.1.3 Injective, surjective, bijective

A function $\sigma : A \rightarrow B$ is called,

1. *Injective (1 to 1)*

$$\forall a_1, a_2 \in A, \sigma(a_1) = \sigma(a_2) \Rightarrow a_1 = a_2$$

2. *Surjective (onto)*

$$\forall b \in B, \exists a \in A, \text{ s.t. } \sigma(a) = b$$

3. *Bijective* (if injective and surjective)

1.1.4 Lemma 1.1.7: 两个 injective/surjective/bijective 的方程的 composition 保留性质

Lemma 1 (Lemma 1.1.7). Suppose $\sigma : A \rightarrow B, \tau : B \rightarrow C$ are functions,

If σ, τ are injective, then $\tau \circ \sigma$ is injective.

If σ, τ are surjective, then $\tau \circ \sigma$ is surjective.

If σ, τ are bijective, then $\tau \circ \sigma$ is bijective.

1.1.5 Proposition 1.1.8: Inverse of Function

Proposition 2 (Proposition 1.1.8). *A function $\sigma : A \rightarrow B$ is a bijection if \exists a function $\tau : B \rightarrow A$ such that*

$$\sigma \circ \tau = id_B = \text{identity on } B (id_B(x) = x, \forall x \in B)$$

$$\tau \circ \sigma = id_A$$

Such τ is unique, called inverse of σ , $\tau = \sigma^{-1}$.

1.2 Set

1.2.1 Well Defined Set

Definition 1. *A set S is **well defined** if an object a is either $a \in S$ or $a \notin S$.*

1.2.2 Power Set

Definition 2. *For any set A , we denote by $\mathcal{P}(A)$ the collection of all subsets of A . $\mathcal{P}(A)$ is the **power set** of A .*

1.2.3 Cardinalities of Sets, Pigeonhole Principle

Definition 3. *If A is a set, $|A|$ = cardinality of A = # of elements*

$n \in \mathbb{N}$, $|\{1, \dots, n\}| = n$; $|\emptyset| = 0$ (\emptyset = empty set).

$|A| = |B|$ if there is a bijection $\sigma : A \rightarrow B$.

If there is an *injection* $\sigma : A \rightarrow B$, we can write $|A| \leq |B|$;

If there is a *surjection* $\sigma : A \rightarrow B$, we can write $|A| \geq |B|$.

Theorem 1 (Pigeonhole Principle). *If A and B are sets and $|A| > |B|$, then there is no injective function $\sigma : A \rightarrow B$.*

1.2.4 B^A : Sets of Function

If A, B are sets, then $B^A = \{\sigma : A \rightarrow B | \sigma \text{ a function}\}$.

Example 1. $n \in \mathbb{Z}$, we define a function $f : B^{\{1, \dots, n\}} \rightarrow B^n (= B \times B \times B \times \dots \times B)$ by the equation $f(\sigma) = \{\sigma(1), \dots, \sigma(n)\}$, where $\sigma : \{1, \dots, n\} \rightarrow B$. The f is a bijection.

证明.

1. *Injective:*

$$f(\sigma_1) = f(\sigma_2) \Rightarrow \{\sigma_1(1), \dots, \sigma_1(n)\} = \{\sigma_2(1), \dots, \sigma_2(n)\}$$

Since $\sigma : \{1, \dots, n\} \rightarrow B$, it is sufficient to prove $\sigma_1 = \sigma_2$.

2. *Surjective*:

$$\forall \{b_1, \dots, b_n\}, \text{ we have } \sigma^*(x) = b_x, x = 1, \dots, n. \text{ s.t. } f(\sigma^*) = \{b_1, \dots, b_n\}$$

□

Example 2.

$$C(\mathbb{R}, \mathbb{R}) = \{\text{continuous functions } \sigma : \mathbb{R} \rightarrow \mathbb{R}\} \subset \mathbb{R}^{\mathbb{R}}$$

1.2.5 Operation definitions

Definition 4. A binary operation on a set A is a function $*$: $A \times A \rightarrow A$.

The operation is associative if $a * (b * c) = (a * b) * c, \forall a, b, c \in A$.

The operation is commutative if $a * b = b * a, \forall a, b \in A$.

Example 3. $+, \circ$ are both associative and commutative operations on $\mathbb{Z}, \mathbb{N}, \mathbb{Q}, \mathbb{R}$; $-$ is a neither associative nor commutative operation on $\mathbb{Z}, \mathbb{Q}, \mathbb{R}$, but not \mathbb{N} .

Definition 5. A subset $H \subset S$ is closed under $*$ if $a * b \in H$ for all $a, b \in H$.

Definition 6. $*$ has identity element $e \in S$ if $a * e = e * a = a$ for all $s \in S$.

2 Equivalence relations and Partition

2.1 Equivalence relations (理性等价的定义)

理性的等价需要满足: (1)Reflexive, (2)Symmetric, (3)Transitive. Given a set X , a relation on X is a subset of $R \subset X \times X$. We write $a \sim b$.

A relation \sim is said to be

1. *Reflexive* if $\forall x \in X$, we have $x \sim x$.
2. *Symmetric* if $\forall x, y \in X, x \sim y \Rightarrow y \sim x$.
3. *Transitive* if $\forall x, y, z \in X, x \sim y, y \sim z \Rightarrow x \sim z$.

The *sim* is called **equivalence relation** if it is *reflexive*, *Symmetric* and *Transitive*.

Example 4. Set $X = \{(a, b) \in \mathbb{Z}^2 | b \neq 0\}$, satisfies $(a, b) \sim (c, d)$ if $ad = bc$.

1. *Reflexive*: $(a, b) \sim (a, b), \forall (a, b) \in \mathbb{Z}^2$.
2. *Symmetric*: $\forall (a, b), (c, d) \in \mathbb{Z}^2, (a, b) \sim (c, d) \Rightarrow (c, d) \sim (a, b)$.
3. *Transitive*: $\forall (a, b), (c, d), (u, v) \in \mathbb{Z}^2, (a, b) \sim (c, d), (c, d) \sim (u, v) \Rightarrow ad = bc, cv = du \Rightarrow acv = adu = bcu \Rightarrow av = bu \Rightarrow (a, b) \sim (u, v)$.

So this is an equivalence relation.

Example 5. $f : X \rightarrow Y$ is a function, define \sim_f on X by $a \sim_f b$ if $f(a) = f(b)$.

1. *Reflexive*: $a \sim a, \forall a \in X$.
 2. *Symmetric*: $a, b \in X, a \sim b \Rightarrow b \sim a$.
 3. *Transitive*: $\forall a, b, c \in X, a \sim b, b \sim c \Rightarrow f(a) = f(b) = f(c) \Rightarrow a \sim c$.
- So \sim_f is an equivalence relation.

2.2 Partition (满足不重叠, 无剩余的 set 拆分结果)

X a set, a partition of X is a collection ω of subsets of X s.t.

- 1) $\forall A, B \in \omega$ either $A = B$ or $A \cap B = \emptyset$.
- 2) $\cup_{A \in \omega} A = X$.

The subsets are the **cells** of partition.

2.3 Equivalence class

2.3.1 $[x]$: equivalence class

Define the **equivalence class** of x to be the subset $[x] \subset X$:

$$[x] = \{y \in X | y \sim x\}$$

Where \sim is an equivalence relation.

\sim is reflexive $\Rightarrow x \in [x]$. We say that any $y \in [x]$ as a **representative** of the equivalence class.

2.3.2 X/\sim : set of equivalence classes

Set of equivalence classes 是一个 **set** 被某种 *equivalence relation* 分类的结果

We write the set of equivalence classes

$$X/\sim = \{[x] | x \in X\}$$

2.4 Relationship of Equivalence relation, Set of equivalence classes and Partitions

给定 X , Equivalence relation \sim 与 Set of equivalence classes X/\sim 具有相同的信息量; 包含所有 Partitions 的集合与包含所有 Set of equivalence classes 的集合相同。

2.4.1 Theorem 1.2.7: Equivalence relation $\sim \Leftrightarrow$ Set of equivalence classes X/\sim ; {all Sets of equivalence classes} = {all Partitions}

Theorem 2 (Theorem 1.2.7). X/\sim is a partition of X . Conversely, given a partition ω of X , there exists a unique equivalence relation \sim_ω s.t. $X/\sim_\omega = \omega$.

(1) Equivalence relation \sim 生成一个对应的 Set of equivalence classes X/\sim , 该 X/\sim 就是一个 Partition。(可以看作 1. 所有 Set of equivalence classes 都是 Partitions; 2. $\sim \Rightarrow X/\sim$ 由方式推结果)
(2) 反之, 我们也可以根据已有的 Partition ω , 将其作为一种分类方式 \sim_ω 的 (i.e. $X/\sim_\omega = \omega$) 这个对应的 \sim_ω 存在且是唯一的。(可以看作 1. 所有 Partitions 都是 Set of equivalence classes; 2. $X/\sim \Rightarrow \sim$ 由结果推方式)

证明.

(1) X/\sim is a partition of X :

$$\forall x, y \in X \text{ s.t. } [x] \cap [y] \neq \emptyset$$

$$\text{Let } z \in [x] \cap [y] \Rightarrow z \sim x, z \sim y$$

$$\forall w \in [x] \Rightarrow w \sim x \Rightarrow x \sim w \Rightarrow z \sim w \Rightarrow w \sim z \Rightarrow w \sim y \Rightarrow [x] \subset [y]$$

$$\text{Similarly we can prove } [y] \subset [x] \Rightarrow [x] = [y]$$

(2) Given a partition ω of X , there exists a unique equivalence relation \sim_ω s.t. $X/\sim_\omega = \omega$:

(2.1) Prove there exists an equivalence relation s.t. $X/\sim_\omega = \omega$:

We define a relation: $x \sim_\omega y$ if there exists $A \in \omega$ s.t. $x, y \in A \Rightarrow \sim_\omega$ is symmetric and transitive.

Since $\cup_{A \in \omega} A = X$, we know $\forall x \in X, \exists A \in \omega$ s.t. $x \in A \Rightarrow \sim_\omega$ is reflexive. So \sim_ω is an equivalence relation.

We know $A = [x], \forall A \in \omega, \forall x \in A$ (by \sim_ω), then $X/\sim_\omega = \{[x] | x \in \cup_{A \in \omega} A\} = \{\{A^* | x \in A^*\} | A^* \in \omega\} = \omega$.

(2.2) Prove the equivalence relation is unique:

Set \sim be any equivalence relation that make $X/\sim = \omega$, then we know $\forall A \in \omega, \exists x \in X$ s.t. $[x] = A$. According to the definition of $[x]$, if $x \in A, y \sim x$ if and only if $y \in [x] = A$. Which is exactly the \sim_ω . \square

Example 6 (the same as example 5). $f : X \rightarrow Y$ is a function, define \sim_f on X by $a \sim_f b$ if $f(a) = f(b)$. In this example the **equivalence classes** are precisely the fibers $[x] = f^{-1}(f(x))$.
 $y \sim_f x \Rightarrow y \in f^{-1}(f(x))$

Example 7 (the same as example 4). Set $X = \{(a, b) \in \mathbb{Z}^2 | b \neq 0\}$, satisfies $(a, b) \sim (c, d)$ if $ad = bc$. i.e. we write the equivalence of (a, b) as $\frac{a}{b} = [(a, b)]$. Then $X/\sim = \mathbb{Q}$.

2.4.2 Proposition 1.2.12: 根据结果 $X/\sim = \{[x] | x \in X\}$ 推断的 \sim_π equals to \sim .

Proposition 3 (Proposition 1.2.12). If \sim is an equivalence relation on X , define a surjective function $\pi : X \rightarrow X/\sim$ by $\pi(x) = [x]$. Then $\sim_\pi = \sim$ (the definition of \sim_f in example 6.)

证明.

(1) Surjective:

$X/\sim = \{[x] | x \in X\} = \{\pi(x) | x \in X\}$, so $\forall y \in X/\sim, y \in \{\pi(x) | x \in X\}$, there exists $x \in X$ s.t. $\pi(x) = y$.

(2) $\sim_\pi = \sim$

$a \sim_\pi b$ if $\pi(a) = \pi(b) \Leftrightarrow [a] = [b]$, which is exactly the definition of \sim . □

逻辑:

1. Given \sim ;
2. Get the corresponding $X/\sim = \{[x] | x \in X\}$;
3. $\pi(x) = [x]$;
4. \sim_π : $a \sim_\pi b$ iff $\pi(a) = \pi(b)$
5. $\sim_\pi = \sim$

根据结果 $X/\sim = \{[x] | x \in X\}$ 推断的 \sim_π equals to \sim .

2.4.3 Proposition 1.2.13: 给 X 标记 $Y: f$, 给 X/\sim 标记 $Y: \tilde{f}$,; 两函数之间一一对应

Proposition 4 (Proposition 1.2.13). *Given any function $f: X \rightarrow Y$ there exists a unique function $\tilde{f}: X/\sim \rightarrow Y$ such that $\tilde{f} \circ \pi = f$, where $\pi: X \rightarrow X/\sim$ in proposition 3. Furthermore, \tilde{f} is a bijection onto the image $f(X)$.*

证明.

(1) Existence:

We define $x_1 \sim_f x_2$ if $f(x_1) = f(x_2)$. Set $\tilde{f}: X/\sim_f \rightarrow Y$, $\tilde{f}([x]) = f(x)$. Then $\tilde{f}[\pi(x)] = \tilde{f}([x]) = f(x)$. Exactly what we require.

(2) Uniqueness:

Set any \tilde{f}' s.t. $\tilde{f}' \circ \pi = f$, then $\tilde{f}'[\pi(x)] = \tilde{f}'([x]) = f(x)$, i.e. the \tilde{f} is unique.

(3) Bijection:

Surjective, which we proved before $\forall f, \exists \tilde{f}$ s.t. $\tilde{f} \circ \pi = f$;

Injective, we also have proved the uniqueness $f = \tilde{f} \circ \pi = \tilde{f}' \circ \pi \Rightarrow \tilde{f} = \tilde{f}'$. □

3 Permutations 改变位置

Definition 7. Let X be a finite set, a permutation is bijection $\sigma: X \rightarrow X$.

Definition 8. Let $S_X(Sym(X))$ be the set of all bijection $\sigma: X \rightarrow X$.

If $|X| = n$, $|S_X| = n!$.

3.1 $Sym(X) = \{\sigma: X \rightarrow X | \sigma \text{ is a bijection}\}$: permutation group of X ; elements in $Sym(X)$: permutations of X

We set $Sym(X) = \{\sigma: X \rightarrow X | \sigma \text{ is a bijection}\} \subset X^X$. We call it **symmetric group of X** or **permutation group of X** . We call the elements in $Sym(X)$ the **permutations of X** or the **symmetries of X** .

3.1.1 Properties of \circ on $Sym(X)$

Proposition 5 (Proposition 1.3.1.). *For any nonempty set X , \circ is an operation on $Sym(X)$ with the following properties:*

- (i) \circ is associative.
- (ii) $id_X \in Sym(X)$, and for all $\sigma \in Sym(X)$, $id_X \circ \sigma = \sigma \circ id_X = \sigma$, and
- (iii) For all $\sigma \in Sym(X)$, $\sigma^{-1} \in Sym(X)$.

Permutations 类似于 rearrangement, 交换 X 中元素的排序。

3.1.2 S_n : Permutation group on n elements, σ^i

Note 1. When $X = \{1, \dots, n\}$, $n \in \mathbb{Z}$, write $S_n = Sym(X)$ **symmetric/permutation group on n elements**.

Note 2. $\sigma \in Sym(X)$, write $\sigma^n = \sigma \circ \sigma \circ \dots \circ \sigma$, $\sigma^0 = id_X$, $\sigma^{-1} = \text{inverse}$, $r > 0$, $\sigma^{-r} = (\sigma^{-1})^r$. So, $r, s \in \mathbb{Z}$, $\sigma^{r+s} = \sigma^r \circ \sigma^s = \sigma^s \circ \sigma^r$.

3.1.3 k -cycle, cyclically permute/fix

Example 8.

$$1 \xrightarrow{\sigma} 2 \xrightarrow{\sigma} 5 \xrightarrow{\sigma} 1, \quad \tau_1$$

$$3 \xrightarrow{\sigma} 4 \xrightarrow{\sigma} 3, \quad \tau_2$$

图 1: Example of Cycle

In the example of *Figure 1*, $\sigma = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 5 & 1 & 4 & 3 & 2 \end{pmatrix}$, $\sigma = \tau_1 \circ \tau_2$, where $\tau_1 = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 5 & 1 & 3 & 4 & 2 \end{pmatrix}$,

$\tau_2 = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 4 & 3 & 5 \end{pmatrix}$. τ_1 is 3-cycle, τ_2 is 2-cycle. We could represent $\tau_1 = (1 \ 2 \ 5) = (2 \ 5 \ 1) = (5 \ 1 \ 2)$,

i.e. $1 \xrightarrow{\tau_1} 2 \xrightarrow{\tau_1} 5 \xrightarrow{\tau_1} 1$. Similarly, we can represent $\tau_2 = (3 \ 4) = (4 \ 3)$, i.e. $3 \longleftrightarrow 4$

We can find that $\forall x \in \{1, 2, 3, 4, 5\}$, $\tau_1^3(x) = x$, $\tau_2^2(x) = x$, so we write τ_1 as a **3-cycle** in S_5 , τ_2 as a

2-cycle in S_5 .

Given $k \geq 2$, a **k-cycle** in S_n is a permutation σ with the property that $\{1, \dots, n\}$ is the union of two disjoint subsets, $\{1, \dots, n\} = Y \cup Z$ and $Y \cap Z = \emptyset$, such that

1. $\sigma(x) = x$ for every $x \in Z$, and
2. $|Y| = k$, and for any $x \in Y, Y = \{\sigma(x), \sigma^2(x), \sigma^3(x) \dots \sigma^k(x) = x\}$.

We say that σ **cyclically permutes** the elements of Y and **fixes** the elements of Z .

$\tau_1 = (1\ 2\ 5)$ **cyclically permutes** the elements of $Y = \{1, 2, 5\}$ and **fixes** the elements of $Z = \{3, 4\}$.

$\tau_2 = (3\ 4)$ **cyclically permutes** the elements of $Y = \{3, 4\}$ and **fixes** the elements of $Z = \{1, 2, 5\}$.

3.2 Disjoint cycles

Since the sets are cyclically permuted by τ_1, τ_2 (i.e. Y) are disjoint. We call the **disjoint cycle notation** $\sigma = \tau_1 \circ \tau_2 = (1\ 2\ 5)(3\ 4)$. (Commute the order is irrelevant)

3.2.1 Theorem: Every permutation is a union of disjoint cycles, uniquely.

Given $\sigma \in S_n$, there exists a unique (possibly empty) set of pairwise disjoint cycles.

Theorem 3. *Let X be a finite set, the graph of permutation $\sigma \in S_X$ is a union of disjoint cycle.*

证明. Prove by induction:

If $|X| = 1$, the graph is circle:

For $|X| > 1$, let $i_1 \in X$ and let $\mathcal{O}(i_1) = \{\sigma^r(i_1), r \geq 0\} = \{i_1, \sigma(i_1), \sigma^2(i_1), \dots\}$. $\mathcal{O}(i_1)$ is finite, and there is a smallest r s.t. $\sigma^r(i_1) \in \{i_1, \sigma(i_1), \sigma^2(i_1), \dots, \sigma^{r-1}(i_1)\}$. Then $\sigma^r(i_1) = i_1$ because other elements already have a pre-change under σ .

Then $i_1 \rightarrow \sigma(i_1) \rightarrow \sigma^2(i_1) \rightarrow \dots \rightarrow \sigma^{r-1}(i_1) \rightarrow i_1$ is a cycle of length r .

For $j \notin \mathcal{O}(i_1), \sigma(j) \notin \mathcal{O}(i_1), \sigma^{-1}(j) \notin \mathcal{O}(i_1)$. Let $Y = X/\mathcal{O}(i_1)$ then $\sigma : Y \rightarrow Y$ is a bijection. Then prove by induction.

□

Example 9. $\sigma_1 = (1\ 2\ 6\ 5)(3)(4)$, can be written by $\sigma_1 = (1\ 2\ 6\ 5), \sigma_2 = (2\ 3\ 5\ 4)$

$$\sigma_1 \circ \sigma_2 = (1 \ 2 \ 6 \ 5) \circ (2 \ 3 \ 5 \ 4)$$

$$\begin{array}{ccc} 1 & \xrightarrow{(2 \ 3 \ 5 \ 4)} & 1 \xrightarrow{(1 \ 2 \ 6 \ 5)} 2 \\ 2 & \xrightarrow{(2 \ 3 \ 5 \ 4)} & 3 \xrightarrow{(1 \ 2 \ 6 \ 5)} 3 \\ 3 & \xrightarrow{(2 \ 3 \ 5 \ 4)} & 5 \xrightarrow{(1 \ 2 \ 6 \ 5)} 1 \\ 4 & \xrightarrow{(2 \ 3 \ 5 \ 4)} & 2 \xrightarrow{(1 \ 2 \ 6 \ 5)} 6 \\ 5 & \xrightarrow{(2 \ 3 \ 5 \ 4)} & 4 \xrightarrow{(1 \ 2 \ 6 \ 5)} 4 \\ 6 & \xrightarrow{(2 \ 3 \ 5 \ 4)} & 6 \xrightarrow{(1 \ 2 \ 6 \ 5)} 5 \end{array}$$

$$\text{Then } \sigma_1 \circ \sigma_2 = (1 \ 2 \ 3) \circ (4 \ 6 \ 5)$$

$$\sigma_2 \circ \sigma_1 = (2 \ 3 \ 5 \ 4) \circ (1 \ 2 \ 6 \ 5)$$

$$\begin{array}{ccc} 1 & \xrightarrow{(1 \ 2 \ 6 \ 5)} & 2 \xrightarrow{(2 \ 3 \ 5 \ 4)} 3 \\ 2 & \xrightarrow{(1 \ 2 \ 6 \ 5)} & 6 \xrightarrow{(2 \ 3 \ 5 \ 4)} 6 \\ 3 & \xrightarrow{(1 \ 2 \ 6 \ 5)} & 3 \xrightarrow{(2 \ 3 \ 5 \ 4)} 5 \\ 4 & \xrightarrow{(1 \ 2 \ 6 \ 5)} & 4 \xrightarrow{(2 \ 3 \ 5 \ 4)} 2 \\ 5 & \xrightarrow{(1 \ 2 \ 6 \ 5)} & 1 \xrightarrow{(2 \ 3 \ 5 \ 4)} 1 \\ 6 & \xrightarrow{(1 \ 2 \ 6 \ 5)} & 5 \xrightarrow{(2 \ 3 \ 5 \ 4)} 4 \end{array}$$

$$\text{Then } \sigma_2 \circ \sigma_1 = (1 \ 3 \ 5) \circ (2 \ 6 \ 4)$$

$$\text{Note: } \sigma_1 \circ \sigma_2 \neq \sigma_2 \circ \sigma_1$$

Example 10 (Exercise 1.3.2.). Consider $\sigma = (3 \ 4 \ 8)(5 \ 7 \ 6 \ 9)$ and $\tau = (1 \ 9 \ 3 \ 5)(2 \ 7 \ 4)$ in S_9 expressed in disjoint cycle notation. Compute $\sigma \circ \tau$ and $\tau \circ \sigma$ expressing both in disjoint cycle notation.

$$\begin{aligned} 1 &\rightarrow \sigma(\tau(1)) = \sigma(9) = 5; \ 2 \rightarrow \sigma(\tau(2)) = \sigma(7) = 6; \\ 3 &\rightarrow \sigma(\tau(3)) = \sigma(5) = 7; \ 4 \rightarrow \sigma(\tau(4)) = \sigma(2) = 2; \\ 5 &\rightarrow \sigma(\tau(5)) = \sigma(1) = 1; \ 6 \rightarrow \sigma(\tau(6)) = \sigma(6) = 9; \\ 7 &\rightarrow \sigma(\tau(7)) = \sigma(4) = 8; \ 8 \rightarrow \sigma(\tau(8)) = \sigma(8) = 3; \\ 9 &\rightarrow \sigma(\tau(9)) = \sigma(3) = 4; \\ \Rightarrow \sigma \circ \tau &= (1 \ 5)(2 \ 6 \ 9 \ 4)(3 \ 7 \ 8) \end{aligned}$$

$$\begin{aligned} 1 &\rightarrow \tau(\sigma(1)) = \tau(1) = 9; \ 2 \rightarrow \tau(\sigma(2)) = \tau(2) = 7; \\ 3 &\rightarrow \tau(\sigma(3)) = \tau(4) = 2; \ 4 \rightarrow \tau(\sigma(4)) = \tau(8) = 8; \\ 5 &\rightarrow \tau(\sigma(5)) = \tau(7) = 4; \ 6 \rightarrow \tau(\sigma(6)) = \tau(9) = 3; \\ 7 &\rightarrow \tau(\sigma(7)) = \tau(6) = 6; \ 8 \rightarrow \tau(\sigma(8)) = \tau(3) = 5; \\ 9 &\rightarrow \tau(\sigma(9)) = \tau(5) = 1; \\ \Rightarrow \tau \circ \sigma &= (1 \ 9)(2 \ 7 \ 6 \ 3)(4 \ 8 \ 5) \end{aligned}$$

Example 11. Let $\sigma, \tau \in S_7$, given in disjoint cycle, notation by $\sigma = (1\ 5\ 4)(3\ 7), \tau = (1\ 3\ 2\ 6\ 4)$,
Compute $\sigma^2, \sigma^{-1}, \tau \circ \sigma$

$$\begin{aligned}\sigma^2 &= (1\ 4\ 5), & \sigma^{-1} &= (4, 5, 1)(3, 7), \\ 1 \rightarrow \tau(\sigma(1)) &= \tau(5) = 5, & 2 \rightarrow \tau(\sigma(2)) &= \tau(2) = 6, \\ 3 \rightarrow \tau(\sigma(3)) &= \tau(7) = 7, & 4 \rightarrow \tau(\sigma(4)) &= \tau(1) = 3, \\ 5 \rightarrow \tau(\sigma(5)) &= \tau(4) = 1, & 6 \rightarrow \tau(\sigma(6)) &= \tau(6) = 4, \\ 7 \rightarrow \tau(\sigma(7)) &= \tau(3) = 2, \\ \Rightarrow \tau \circ \sigma &= (1, 5)(2, 6, 4, 3, 7)\end{aligned}$$

3.3 Transposition

Definition 9. A *transposition* is a cycle of length 2: $\sigma = (i\ j)$.

3.3.1 Theorem: 每个 permutation 可以由若干个 (可能不 disjoint 的) transposition 表示

Theorem 4. Every permutation σ of X is a product of transposition. (the product is not unique)

Equivalent: Given $n \geq 2$, any $\sigma \in S_n$ can be expressed as a composition of 2-cycles.(not require disjoint)

证明.

Version 1:

$$\begin{aligned}(x_1\ x_k)(x_1\ x_2, \dots\ x_{k-1}\ x_k) &= (x_1\ x_2\ \dots\ x_{k-1}) \\ (x_1\ x_2\ \dots\ x_{k-1}\ x_k) &= (x_1\ x_k)(x_1, x_2\ \dots\ x_{k-1}) \\ &= (\mathbf{x}_1\ \mathbf{x}_k)(\mathbf{x}_1\ \mathbf{x}_{k-1})(\mathbf{x}_1\ \mathbf{x}_2\ \dots\ \mathbf{x}_{k-2}) \\ &\dots \\ &= (\mathbf{x}_1\ \mathbf{x}_k)(\mathbf{x}_1\ \mathbf{x}_{k-1})(\mathbf{x}_1\ \mathbf{x}_{k-2}) \dots (\mathbf{x}_1\ \mathbf{x}_2)\end{aligned}$$

Version 2:

$$\begin{aligned}(x_1\ x_2, \dots\ x_{k-1}\ x_k)(x_1\ x_k) &= (x_2\ x_3\ \dots\ x_k) \\ (x_1\ x_2\ \dots\ x_{k-1}\ x_k) &= (x_2\ x_3\ \dots\ x_k)(x_1\ x_k) \\ &\dots \\ &= (\mathbf{x}_{k-1}\ \mathbf{x}_k)(\mathbf{x}_{k-2}\ \mathbf{x}_k) \dots (\mathbf{x}_2\ \mathbf{x}_k)(\mathbf{x}_1\ \mathbf{x}_k)\end{aligned}$$

□

Claim 1. Cycle of length k can be written as a product of $k - 1$ transpositions.

3.3.2 Sign of Permutation

Theorem 5. *Although the product of transposition of a permutation is not unique, the parity (odd or even) of the n in a product is unique. We call it the **sign** of permutation.*

$$\begin{aligned} \text{sign}(\sigma) &= (-1)^{(\# \text{ even-length cycles in } \sigma)} \\ &= (-1)^{(\# \text{ transpositions in } \sigma)} \end{aligned}$$

Example 12.

$\sigma_1 = (1\ 4\ 7\ 9)(2\ 8)(6\ 10)$: $N = 3 + 1 + 1 = 5$ is odd.

$\sigma_2 = (1\ 2\ 3\ 4\ 5)(6\ 7\ 8\ 9\ 10)$: $N = 4 + 4 = 8$ is even

What happens to a permutation σ 's cycles if $\sigma \rightarrow (i\ j) \circ \sigma$?

1. i and j are not contained in σ .
2. i and j appear in the same cycle of σ .
3. i and j appear in disjoint cycles.

$$\begin{aligned} (i\ j) \circ (i\ -\ -j\ \sim\sim) &= (i\ -\ -) \circ (j\ \sim\sim) \\ (i\ j) \circ (i\ -\ -) \circ (j\ \sim\sim) &= (i\ -\ -j\ \sim\sim) \end{aligned}$$

Proposition 6. $\text{sign}((i\ j) \circ \sigma) = -1 \cdot \text{sign}(\sigma)$

证明.

Suppose $\sigma = (a_1\ a_2\ \dots\ a_k\ b_1\ b_2\ \dots\ b_l)$

Then $(a_1\ b_1) \circ \sigma = (a_1\ a_2\ \dots\ a_k)(b_1\ b_2\ \dots\ b_l)$

$$\text{sign}(\sigma) = \begin{cases} +1 & \text{if } k+l \text{ is odd} \\ -1 & \text{if } k+l \text{ is even} \end{cases}$$

$$\text{sign}((a_1\ b_1) \circ \sigma) = \begin{cases} -1 & \text{if } k+l \text{ is odd} \\ +1 & \text{if } k+l \text{ is even} \end{cases}$$
